

python_zip函数

zip 可以同时遍历2个序列（字符串，list，元组），并且以2个中最短的序列长度为遍历次数，比如list1和list2，list1长度为3，list2为4，遍历循环次数为3

```
list1=[1,2,3,4,5]
```

```
list2=[2,3,4]
```

```
for i,j in zip(list1,list2):
```

```
    print('list1---%s'%i)
```

```
    print('list2---%s'%j)
```

```
tuple1=(1,2,3,4,5)
```

```
tuple2=(1,2,3)
```

```
for i,j in zip(tuple1,tuple2):
```

```
    print('tuple1---%s'%i)
```

```
    print('tuple2---%s'%j)
```

```
str1='1234'
```

```
str2='12345'
```

```
for i,j in zip(str1,str2):
```

```
    print('str1---%s'%i)
```

```
    print('str2---%s'%j)
```
