```
python_多线程加锁
python3多线程可以不加锁,每个多线程就自带锁
python2多线程必须加锁,多线程本身不带锁
加锁有两种方式,一种如下图:
import time, threading
count=0 #声明全局变量
lock=threading.Lock() #申请一把锁
def lajifenlei():
   global count 期用全局变量
   lock.acquire() #加锁
   count+=1
   time.sleep(1)
   print(count)
for i in range(10):
    th = threading.Thread(target=lajifenlei,) #声明线程数
    while threading.activeCount()!=1:
   pass
C:\Users\zhaow\AppData\Local\Programs\Python\Python37\python.exe D:/study/python/atp/lib/t.py
10
```

1010

101010

10

10

1010

另一种类似打开和关闭文件的with方法,自动开关锁

```
import time, threading
count=0 ##明全局变量
lock=threading.Lock() #申请一把锁
def lajifenlei():
    global count #別用全局变量
    with lock: #with擴换自动加锁及解锁
    count=1
    time.sleep(1)
    print(count)

for i in range(10):
    th = threading.Thread(target=lajifenlei,) ##明线程数
    th.start() #启动线程
while threading.activeCount()!=1:
    pass
```
